Abstract of FR2804234

A smart card(s) includes an operating system and an interface for presentation and verification of an authentication string of a user. A system of the card uses a mechanism forcing the access to the presentation and verification interface of the authentication string when it initiates the process at the time of a demand of authentication string from a terminal. Independent claims are included for: (a) a multiple application smart card (b) a terminal capable of communication with a smart card
